Safety and security is an increasingly difficult challenge for owners and operators in the retail petroleum industry. We can help overcome the theft, vulnerabilities, and compliance challenges facing gas stations today.

The Defender One is an electronic security system that monitors access panels to prevent unauthorized entry.

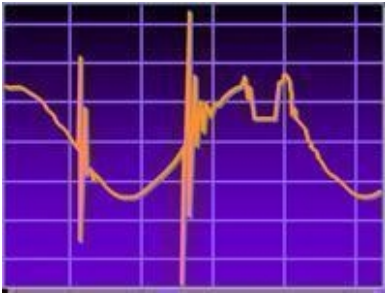

- **Works with all POS systems**
- **Plug in installation for Gilbarco® and Wayne®**
- **Disables dispenser without interrupting power**
- **Automatically arms, you are always protected**
- **Internal battery maintains operation in the event of a power failure**

DEFENDER ONE

An audible tone and siren will sound if an intrusion is detected

The louder internal siren will turn off after two minutes. The defender will continue with a soft beep until a manager or technician has examined the disabled dispenser.

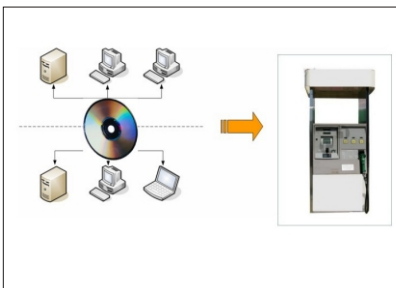

A patent pending soft method of disabling the dispenser.

When an intrusion is detected, both sides of the dispenser are disabled by the Defender One with no interruption of the dispenser power. Fuel cannot be dispensed on either side of the dispenser, yet the dispenser retains full power! Transactions do not get lost.

No false alarms due to the unique design of our sensors and anchors

The sensors have been specifically designed for use in a petroleum dispenser. The sensor anchors are designed to lock into place when the dispenser doors are closed.

Automatic arming of the security system

The software in the Defender One is specifically designed for a retail fuel pump/dispenser. The Defender One will automatically arm itself within 30 seconds after the dispenser doors are secured.

Each Secure remote is unique

A secure remote is the primary device used for disarming the Defender One system. If security is breached by a lost remote, the existing system can be re-programmed to accept a new remote. Only one remote is necessary per station.
